

# Multiple pumps type PFEX, PFRX, PVPCX2E

vane, piston, fixed or variable displacement

Multiple pumps are composed by various vane, radial piston or axial piston pumps modularly assembled:

- PFEX**, see section 1, are composed by vane pumps PFE (table A005 and A007) or PFED (table A180);
- PFRX**, see section 2, are composed by radial piston pumps PFR (table A045) and vane pumps PFE (table A005 and A007)
- PVPCX2E**, see section 3, are composed by axial piston pumps PVPC (table A160) and vane pumps PFE (table A005 and A007)

For multiple pumps must be verified that the max torques applied on each single drive shaft and on each single through shaft are not higher than the max allowed limits. In particular, must be considered that the total torque applied to the drive shaft of the first element is the sum of the single torque needed for operating each single pump.

In the figure are shown:

M1, M2, M3, = torque needed to operate each single pump (obtainable from "torque versus pressure diagram" of each single pump).

$L_{DS1}$ ,  $L_{DS2}$ ,  $L_{DS3}$  = limits of torque for drive shafts;

$L_{TS1}$ ,  $L_{TS2}$  = limits of torque at the end of through shafts.

The values of torque needed to operate each single pump and the allowed limit torque values for drive shafts and through shafts are shown on technical tables of individual basic pumps.

**For multiple pumps, the following verifications must be executed:**

- $M3 \leq L_{TS2}$
- $M3 + M2 \leq L_{DS2}$
- $M3 + M2 \leq L_{TS1}$
- $M3 + M2 + M1 \leq L_{DS1}$

## 1 PFEX2, PFEX3, PFEXD MULTIPLE VANE PUMPS

PFEX\* are fixed displacement multiple vane pumps. They can be double (composed by two pumps type PFE) or triple pumps (composed by three PFE or by one PFE and one PFED).

For technical characteristics of PFE-\*1 pumps, see tab. A005; for technical characteristics of PFE-\*2 see tab. A007; for technical characteristics of PFED pumps, see tab. A180.

(1) Further composition of PFR and PFE double pumps are available on request. Other composition of PFRX2E must subject to verification of max torque limits allowed by the drive shafts of PFR and PFE and by the through shaft of PFR (320 Nm).

(2) Max speed is 1800 rpm for /PE versions; 1000 rpm for /WG versions

(3) Flow rate and power consumption are proportional to revolution speed

(4) Max pressure is 250 bar for /PE versions, 175 bar for /WG versions

(5) Max pressure is 160 bar for /PE and /WG versions.

The shaft of the PFR pump has an eccentric cam which rotates with the shaft generating the stroke of the pistons and thus generating the flow rate. For best functioning a balanced coupling should be provided between the shaft of the motor and the shaft of the pump. See tab. A045

### 2.4 TRIPLE PUMPS TYPE PFRX3E AND PFRXD

Many triple pump compositions PFRX3E = PFR + PFEX2 or PFRXDE = PFR + PFED can be realized but they must be subject to verification of max torque-limits allowed by drive shaft and through shaft of each individual basic pump according to description of first page.
